

Below are examples of **straight** and **drop** axles.

The top straight axle depicts a **hub** on the left side and a hub with brake drum (**hub-drum**) on the right side.

The lower axle depicts a **drop axle** without hubs or drums

The **spring centers** identify the position of the springs and mounting hardware and should align with the mounting positions on the trailer frame rails.

Note that the springs can be mounted above (**overslung**) or below (**underslung**) the axle. This will raise or lower the axle depending on the configuration.
